“Organic and Carbon Nanotube Electronics”

Zhenan Bao
Department of Chemical Engineering
Stanford University

Abstract:

Organic and carbon nano materials are now being considered as the active materials for various applications, such as displays, electronic circuits, solar cells, chemical and biological sensors. In this talk, I will discuss our recent work on synthesis, self-assembly and alignment of organic semiconductor micro and nanowires and carbon nanotubes. Applications of these materials in transistors and transparent electrodes will also be presented.
